

Arborist

Do you spend most of your day out in the field with clients...or evaluating trees?

Have you ever thought, “There has to be an easier way to manage tree records and data?” Well, now there is... [Introducing PlantMapper.com](http://PlantMapper.com)

What if your cell phone could locate trees—not only by GPS coordinates—but also by address? What if a simple email could store the type, size, photograph and notes about each tree? What if every record could be stored automatically in your account—and was viewable from your computer?

What if we could print you a report with a map of all your clients—showing you all of the trees you have worked on, and all available data for each tree?

All of these things—and more—are now possible with PlantMapper.com: all of your tree records at just the click of a cell phone button.

And these features are just those that are available from your cell; from your PC, the options are even more incredible: you can upload 100s of specimens at a time. Or you can use Google Maps to search for trees and upload photos for leaf silhouettes, bark and flowering habits. Each record will search for standard images and standard Wikipedia data for that particular specimen. It's like having a tree journal—only faster and more dynamic!

When you are using PlantMapper.com you will find you can print reports with maps, print tree certificates, track maintenance, track diseases—and make all your work organized and easily-accessible to just you, your team and specific clients.
