In today's day and age, connections to our natural environment are more important than ever. With PlantMapper.com's free, simple software you and your students can enhance your campus with a better tree cover, more-appropriate greenery and help your maintenance department understand the proper care of trees. In short, you can make a big impact on your students' quality of education.

The amazing PlantMapper software allows you to:

- Document the ages of trees
- Photograph each tree
- Catalog the plant names on record for each tree, size and measurements, removals dates, Latin and common names

And if you or your students have a cell phone with a data plan...better yet: you can add the specimen info directly from the field. (However, good ole-fashioned paper works well, too, for taking notes in the field!)

PlantMapper.com also has a whole host of incredible features. Tap into your facilities management work with a tree management program. View work-to-date and also manage your campus through the common Google maps interface.

Our software gives you the power to take the time to embrace the eco generation...make your campus green and showcase your local asset. Furthermore, you can create a webpage which shows all your trees and allows your students to easily view the local asset—allowing you and your students to reconnect with the environment.

**Finally, PlantMapper lets you publish GIS data to the web through [Plantmapper.com](http://Plantmapper.com) or create an inventory and scale up to GIS.**

Come join us on [PlantMapper.com](http://PlantMapper.com) to begin your mapping journey today.
